

My First 90 Days as a Scaled CSM at Harvey

A ramp plan — prepared by Alex Donnelly

Illustrative plan built for the Scaled Customer Success Manager application; based on Harvey's public product set, not internal information. Not affiliated with or endorsed by Harvey.

My operating belief: in scaled CS, the fastest path to retention is productized adoption — lift the whole book with reusable enablement, then spend high-touch time only where it moves the number. Here's how I'd ramp into that.

Days 0–30 — Learn the product, the playbooks, and the book

- **Product fluency:** get hands-on across Assistant, Vault, Knowledge, and Workflow Agents so I can speak to real customer workflows, not features.
- **Shadow & absorb:** sit in on value reviews/QBRs and renewal calls; learn the existing scaled playbooks and the CS platform, health scores, and reporting.
- **Read the book:** segment my accounts by health, usage, value realized, and renewal date — build a triaged priority list (who's at risk, who's ready to expand).
- **Meet the partners:** establish working relationships with Sales, Legal Engineering, and Product so the feedback loop is live from day one.

Outcome: a triaged book and a prioritized 60-day action plan.

Days 31–60 — Engage every account, stabilize the at-risk

- **Touch the whole book:** launch or sharpen self-serve onboarding, office hours, and use-case templates so low-touch accounts still progress toward a daily habit.
- **Run value reviews:** deliver the first round of value reviews to key accounts, translating usage into ROI the sponsor can defend.
- **Work the risk:** identify churn signals early and run structured interventions on the most at-risk accounts before they reach the renewal window.
- **Spot expansion:** flag the first seat-add and cross-team expansion candidates from usage signals.

Outcome: every account engaged, at-risk plays in motion, measurable adoption lifts.

Days 61–90 — Prove value, make it repeatable

- **Handle first renewals:** carry early renewals on evidence, not last-minute scrambles; document the ROI stories behind them.
- **Ship a reusable asset:** build one playbook or template that measurably lifts the whole book — the scaled multiplier.
- **Close the loop:** bring structured customer feedback to Product and Legal Engineering to influence the roadmap.
- **Set the cadence:** lock in a weekly health scan, monthly check-ins/office hours, and quarterly value reviews across the book.

Outcome: gross retention protected, first expansions identified, and a repeatable motion teammates can reuse.

How I'd measure myself

Adoption / weekly active usage across the book • value reviews delivered • at-risk accounts saved • gross and net revenue retention trajectory • expansion pipeline created.
